## AUTOMATIC TRAIN CONTROL – TRACK CIRCUIT MONITORING TOOL

PRESENTATION TO

**Transit Industry**

# Washington Metropolitan Area Transit Authority

## NTSB RECOMMENDATIONS:

R-09-6 Urgent to WMATA – Enhance safety redundancy by evaluating track occupancy and automatically generate alerts.

R-09-7 Urgent to FTA – Advise all transit operators with systems that can monitor train movement. Add redundancy by evaluating track occupancy data on a real time basis to automatically generate alerts and speed restrictions to prevent train collisions.

## ATC Track Monitoring Tool (LOS Tool)

Information gathered from wayside to the Advanced Information Management (AIM) Computer

Track Circuit Monitoring Computer uses TWC and occupancy data to identify train

1. Create sequential occupancy  
Based on civil characteristics, Physics of movement. Isolate occupied bobbing track circuits
2. Segregate anomalies such non sequential track circuit bobbing.  
These would violate the civil and physical characteristics of Train Movement
2. Strict fit plot  
Train length is plotted within the occupied circuits

## Bobbing Track Circuits

What :

When a track circuit shows an occupancy with no train present or no occupancy with a train present. These conditions are inconsistent with track conditions and the civil and physical characteristics of the system.

Effects:

When a train is in a track circuit that is bobbing it can cause a potential safety failure which must be addressed in the shortest possible time.

When a train is not in the circuit it produces false restrictions on train movement, disrupts the Passenger Information Display System (PIDS)

Mitigation / Correction: When a potential safety failure is detected the maintenance and operations staff is immediately notified for action response. For non safety related failures each week the ATC engineering rail maintenance liaison provides a summary of the most severe track circuits for repair (10 bobs per hour)

## Summary of Business Process

### Actions in Rail Operations Control Center

- Implement SOP # 15 Absolute Block Procedure
- Direct Train Operator

### Actions by Maintenance Operations Control

- Dispatch ATC technicians to the location
- Open Maximo ticket

### Actions by Automatic Train Control

- Respond to site immediately
- Turn circuit off, perform inspection
- Perform and document results from applicable PMI's

# Washington Metropolitan Area Transit Authority

## Actions by Engineering

- Review data to verify alarm

- If false alarm inform MOC and help restore normal operations

## Actions by SAFE

- Review after action report of all actions

- Certify that action is closed

- Confirm Return to safe operations

# Washington Metropolitan Area Transit Authority

## T163 Test

Purpose: To ensure that abnormalities that may cause the track circuit to lose the ability to detect the presence of a train are located in a timely manner.

When : Done semiannually and when triggered by the ATC-Track Circuit Monitoring Tool Alarm

Special Equipment: Multi-channel Oscilloscope with minimum 100 MHz speed and Isolated Channels

Training: Engineering provided training to a core group in our maintenance department. It takes three technicians to perform this test.

# Washington Metropolitan Area Transit Authority Example of Transmit Signals Both Good and Bad

**Oscillation Type 1: Clean sinusoidal waveform**

**Oscillation Type 2: Continuous oscillation**

**Oscillation Type 3: Tx Local oscillations**

**Oscillation Type 4: External Tx oscillations**

## Corrugated Rail

What : Corrugated rail is a rail defect characterized by a repeated wavelike wear pattern on the railhead that may extend over several hundred feet or more of running rail

Effects: Trains moving at high speed over sections of corrugated rail may produce wheel sparks (or arcing) that sporadically and very briefly stimulate a track circuit's receiver.

Mitigation: Medium speed restrictions are routinely installed to slow trains and mask the effects of CRS.

Correction: Rail grinding.
