

Applying Data Science Tools to Transit Planning

Applications in Time-Series Ridership Analysis

Joel Huting, Metro Transit

Overview

- Seasonal-trend decomposition of ridership
- Time-series forecasting methods
- Metro Transit Web-based ridership analysis app
- Open-source app for any agency to use

Seasonal-Trend decomposition (STL)

- Transit ridership data are noisy
 - Seasonal variation
 - Random variation
 - Underlying trend
- STL allows us to quickly and easily decompose ridership
 - Identify underlying “big picture” changes
 - Identify seasonal fluctuations
 - Easy to operationalize through apps
- Decompose time-series of any frequency
 - Daily
 - Monthly

Step 1. Plot ridership time-series

Route 2 Monthly Average Weekday Ridership

Step 2. Extract trend

Route 2 Monthly Average Weekday Ridership

Step 3. Remove trend

Route 2 Seasonal Component + Random Variation

Step 4. Extract seasonal component

Step 5. Summary of STL

Forecasting

- Use past values of ridership to forecast future values
- Seasonality, trend, etc.
- Baseline for developing goals, budgets, planning service levels, etc.
- Many different types of models – as a general rule use ensemble of models
- Can incorporate predictor variables

1. Build and examine ridership models

Route 2 Ridership Model

2. Compare model fit to data

3. Make Forecast (Data Ending Dec 2015)

Route 2 Forecast (Data Ending Dec 2015)

Accuracy

- Models have performed very well over last several years
- Below is the YTD difference between forecast and actual by mode:

Mode/Route Type	2017 YTD Mean Absolute Percent Error (MAPE)
All Bus	1.62%
Express	2.63%
Urban Local	1.66%
Suburban Local	2.38%
Green Line	4.22%
Blue Line	8.26%
Northstar	8.93%

Operationalizing Models

Metro Transit Route-Level Ridership Analysis App:

<https://metrotransitmn.shinyapps.io/RouteTrends/>

Any Transit Agency can load their own data:

Service
Rush and Non-Rush

Show Actual Data on Route Charts
 Show Productivity for Modal Chart
 Start Y-Axes at Zero

Date Range: Jan 2008 – May 2017

Route 2 - Weekday serves Franklin Av - Riverside Av - U of M - 8th St SE
 First trip starts at 4:47:00 AM
 Last trip starts at 1:23:00 AM
 Service spans 20:36 hours

Detail: The first two plots display ridership trend and productivity trend for the combination of inputs selected (Route, Schedule, and Service). The third plot shows the ridership or productivity trend (based on whether Show Productivity for Modal Chart is checked) of the route class in which the selected route is. You can use the range selector at the bottom of the page to zoom in or out the plot within the date range. Plots default to plotting with zeroed y-axes. To zoom in the y-axes, uncheck Start Y-Axes at Zero checkbox.

- STL Decomposition by Route
- Feedback

Select Routes:

Reference Date:

Comparison Date:

- Sort by Percent Change
- Plot Actual Rides (Default to Trend)

Detail: Negative trend means the route has been having a downward sloping trend, in other word ridership has been decreasing when adjusted for seasonality. Positive trend indicates an increase in ridership. You can select as many routes as you want, but more than 20 at a time is not recommended. Check Sort by Percent Change in Trend to sort by percent change instead of absolute change. The table below the plots displays the underlying data.
